#### Abstract

Chalcones have been reported to present various biological activities such as antiinflammatory, antioxidant, antitubercular, antibacterial activities. It is a basic moiety of many heterocyclic systems containing oxygen, sulphur and nitrogen. Nitrogen containing heterocyclic derivatives synthesized from Chalcones have exhibited anti-inflammatory, anticancer and antimicrobial activities. An attempt has been made to synthesize Chalcones by the reaction of 3-acetyl-2,5-dimethylfuran with various aromatic and heteroaromatic aldehydes. Further, Chalcones derivatives were cyclised to pyrimidine analogs by using guanidine hydrochloride. The newly synthesized pyrimidine derivatives have been characterized by IR, ${ }^{1} \mathrm{HNMR},{ }^{13} \mathrm{CNMR}$, Mass spectra and elemental analysis and evaluated for their anti-inflammatory, anticancer, antifungal and antibacterial activities. It was found that 2 -amino pyrimidine analog bearing 4 -chloro substitution on phenyl ring has exhibited excellent anticancer activity at lowest concentration in the series moreover it has also exhibited good anti-inflammatory and antibacterial activities.

Keywords: Chalcones, pyrimidine, anticancer activity, antifungal activity, antibacterial activity.

[^0]
## INTRODUCTION

Heterocyclic compounds are abundant in nature and having a great significance to life because their structural subunits exist in many natural products such as vitamins, hormones, antibiotics etc. A practical method for the synthesis of such compounds is of great interest in synthetic organic chemistry ${ }^{1}$. Nitrogen containing heterocyclic play an important role in medicinal chemistry. Pyrimidine is a six-member heterocyclic compound that contains two nitrogen atoms at positions 1 and 3. The structure of the pyrimidine ring is similar to benzene and pyridine ${ }^{2}$. The key role pyrimidine play in cellular processes has made them valuable leads for drug discovery ${ }^{3}$. Pyrimidine derivatives are known to be biologically active compounds and substituted pyrimidines have shown wide range of biological activities like anticancer ${ }^{4-9}$, antibacterial ${ }^{4,7,9-11}$, antifungal ${ }^{4,8}$, anti-inflammatory ${ }^{12}$ activity.

## MATERIALS AND METHOD

All the melting points were determined in a Boitus melting point apparatus and are uncorrected. The ${ }^{1} \mathrm{H}$ NMR spectra of the compounds were recorded on Bruker AMX 400 MHz NMR spectrophotometer using TMS as an internal standard and the values are expressed in $\delta \mathrm{ppm}$.

The ${ }^{13} \mathrm{C}$ NMR spectra of the compounds were recorded on Bruker AMX 400 MHz NMR spectrophotometer using TMS as an internal standard and the values are expressed in $\delta \mathrm{ppm}$. The mass spectra of the compounds were recorded either on on Agilent 1100 ESI-Mass (Turbo Spray) Spectrophotometer or API-ES mass spectrometer using positive mode ionization method. Reactions were monitored by TLC using silica gel-G ( Merck grade) as the adsorbent and the solvent systems are indicated at appropriate places. Silica gel (100-200 mesh, Merck grade) has been used for column chromatography. The column was subjected to gradient elution using n-hexane, mixtures of hexane and ethyl acetate ( $5 \%, 10 \%, 15 \%, 25 \%$, $50 \%$ and $75 \%$ hexane in ethyl acetate), ethyl acetate and mixtures of ethyl acetate and methanol ( $1 \%, 2 \%, 5 \%$ and $10 \%$ ethyl acetate in methanol). Fractions each of 100 mL were collected. The separations of the compounds were checked on TLC under UV lamp and also by spraying the plates with $10 \%$ sulphuric acid. Elemental analyses were carried out with a Perkin-Elmer model 2400 series II apparatus. The results of elemental analyses (C,H,N) were within $\pm 0.4 \%$ of the calculated values.

## General procedure for the synthesis of chalcones by Claisen-Schmidt condensation:

Equimolar quantities ( 0.005 mol ) of 3-acetyl-2,5-dimethylfuran and respective aldehydes were mixed and dissolved in minimum amount of alcohol. To this, aqueous potassium hydroxide solution ( $50 \%, 7.5 \mathrm{~mL}$ ) was added slowly and mixed occasionally for 24 h , at room temperature. Completion of the reaction was identified by TLC using silica gel-G. After
completion of the reaction, the mixture was poured onto crushed ice, acidified if necessary with dilute hydrochloric acid, and the solid that separated was isolated by filtration, dried and purified by column chromatography on silica gel with a mixture of ethyl acetate and hexane as the mobile phase. The overall reaction involving the formation of chalcones are shown in

\text { C = 1-(2',5'-dimethyl-3'-furyl)-3-(aryl)-2-propen-1-one }
\end{gathered}
$$

## General procedure for the synthesis of pyrimidines:

The condensation of the chalcones with guanidine hydrochloride in an alkaline medium using potassium hydroxide in the presence of ethanol, at reflux temperatures ( 2 to 6 h ) resulted in the formation of corresponding pyrimidines (Scheme 2). Completion of the reaction was established by TLC using silica gel-G. After completion of the reaction, the reaction mixture was poured onto crushed ice with constant stirring. The solid that separated was filtered, dried and purified by column chromatography on silica gel, using a mixture of ethyl acetate and hexane as the mobile phase. The purified pyrimidine derivatives were obtained as light to bright yellow fine powders.

List of synthesized 2,4,6-trisubstituted pyrimidine compounds:

1. 2-amino-4-( $2^{\prime}, 5^{\prime}$-dimethyl-3'-furyl)-6-( $3^{\prime \prime}, 4^{\prime \prime}, 5^{\prime \prime}$-trimethoxyphenyl) pyrimidine ( $\mathbf{P M}_{1}$ )
2. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(4'-chlorophenyl)pyrimidine( $\mathbf{P M}_{2}$ )
3. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(4'-dimethylaminophenyl)pyrimidine ( $\mathbf{P M}_{3}$ )
4. 2-amino-4-( $2^{\prime}, 5^{\prime}$ 'dimethyl-3'-furyl)-6-(4'-methylphenyl)pyrimidine ( $\mathbf{P M}_{4}$ )
5. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-( $\mathbf{2}^{\prime \prime}, 4{ }^{\prime \prime}$ dichlorophenyl)pyrimidine (PM5)
6. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(9'-anthracenyl)pyrimidine ( $\mathbf{P M}_{6}$ )
7. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(4'-methoxyphenyl)pyrimidine ( $\mathbf{P M}_{7}$ )
8. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(3',4'-dimethoxyphenyl)pyrimidine (PM $\mathbf{P}^{\prime}$ )
9. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(4'-flurophenyl)pyrimidine (PM9)
10. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(4'-nitrophenyl)pyrimidine ( $\mathbf{P M}_{10}$ )
11. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(2''-pyridinyl)pyrimidine (PM $\mathbf{H}_{11}$ )
12. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(3'-pyridinyl)pyrimidine (PM $\mathbf{P}_{12}$ )
13. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(4'-pyridinyl)pyrimidine (PM ${ }^{\prime}$ )
14. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(2'-thienyl)pyrimidine (PM ${ }^{14}$ )

## RESULTS AND DISCUSSION:

## Spectral properties of pyrimidines:

The 2,4,6-trisubstituted pyrimidines showed the C-5-H proton as singlet around $\delta 7.0-7.35$ and a broad signal at $\delta$ 5.15-5.25 due to the amino protons and another two singlets at $\delta 2.2$ and 2.9 each integrating for three protons attributed to aromatic methyl groups. The spectrums also accounted for the other three aromatic protons of the furan and the phenyl rings in between $\delta$ 6.45-7.40.

## Antimicrobial studies of pyrimidines:

## Antibacterial activity:

Each test compound ( 5 mg ) was dissolved in dimethyl sulfoxide ( 5 mL ) to give a concentration of $1000 \mu \mathrm{~g} / \mathrm{mL}$.Benzyl penicillin solution was prepared to give a concentration of $1000 \mu \mathrm{~g} / \mathrm{mL}$ in sterilized distilled water. All the compounds were tested at dose levels of $50 \mu \mathrm{~g}(0.05 \mathrm{~mL})$ and $100 \mu \mathrm{~g}(0.1 \mathrm{~mL})$ and DMSO used as a control. The solutions of each test compound, control and reference standards ( 0.05 and 0.1 mL ) were added separately in the cups and the plates were kept undisturbed for at least 2 h in a refrigerator to allow diffusion of the solution properly into nutrient agar medium. Petri dishes were subsequently incubated at $37 \pm 1{ }^{0} \mathrm{C}$ for 24 h . After incubation, the diameter of zone of inhibition surrounding each of the cups was measured with the help of an antibiotic zone reader.

Among all the compounds tested, compounds $\mathbf{P M}_{\mathbf{2}}, \mathbf{P M}_{\mathbf{5}}, \mathbf{P M}_{\mathbf{1 1}}$ and $\mathbf{P M}_{\mathbf{1 3}}$ produced maximum inhibitory zones. All these compounds possessed the electron withdrawing substituent's on the aromatic ring, except in the case of last two compounds, where the aromatic ring is replaced by hetero aryl rings.

## Antifungal activity of pyrimidines:

Each test compound ( 5 mg ) was dissolved in dimethyl sulfoxide ( 5 mL ) to give a
concentration of $1000 \mu \mathrm{~g} / \mathrm{mL}$. Fluconazole solution was also prepared at a concentration of $1000 \mu \mathrm{~g} / \mathrm{mL}$ in sterilized distilled water. All the compounds were tested at dose levels of 50 $\mu \mathrm{g}(0.05 \mathrm{~mL})$ and $100 \mu \mathrm{~g}(0.1 \mathrm{~mL})$ and DMSO used as a control. The solutions of each test compound, control and reference standards ( 0.05 and 0.1 mL ) were added separately in the cups and the plates were kept undisturbed for at least 2 hr in a refrigerator to allow diffusion of the solution properly into the PDA medium. Petri dishes were subsequently kept at room temperature for 48 h . After that, the diameter of zone of inhibition in mm surrounding each of the cups was measured with the help of an antibiotic zone reader.

| Fluconazole | (standard) | 24 | 28 | 24 | 28 | 22 | 27 |

Among all the compounds $\mathbf{P M}_{\mathbf{3}}, \mathbf{P M}_{5}$ and $\mathbf{P M}_{\mathbf{9}}$, which carries 4-dimethylaminophenyl, 2,4dichlorophenyl and 4-fluorophenyl substituent's at C-6 position of pyrimidine ring exhibited maximum activity. The results clearly revealed the contribution of electron withdrawing groups and electron releasing groups on the aromatic ring in enhancing the antifungal activity.

## Anticancer activity of pyrimidines

The synthesized pyrimidines have been screened for anticancer activity on prostate cancer
cell lines ( DU-145) using MTT based cytotoxicity assay. DMEM (Dulbecco's Modified Eagles Medium), $10 \%$ Fetal bovine serum (FBS),MTT reagent : 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide,Cell lines: DU-145 cell lines, were obtained from the National Centre for Cell Science ( NCCS), pune ( India) were used for this study.

This method is based on a colorimetric assay which takes into account the ability of a mitochondrial dehydrogenase enzyme from viable cells to cleave the tetrazolium rings of the pale yellow MTT and form dark blue formazan crystals which is largely impermeable to cell membranes, thus resulting in its accumulation within healthy cells. The level of formazan created is a reflection of the number of surviving cells and shows a proportionality relationship between them. The required cell proliferation assay kit was obtained from Roche Applied Sciences, Germany The procedure consists of seeding an equal number of DU-145 cells in each well of a 96 - well microplate and incubating at $37^{\circ} \mathrm{C}$ in the presence of $5 \% \mathrm{CO}_{2}$. Various concentrations of the test substances were added to the cells. For every 24 h the culture medium was renewed with the test substances. $0.5 \%$ DMSO was added into the vehicle control culture wells. After 72 h treatment, $5 \mu \mathrm{~L}$ of MTT reagent (R\&D systems USA) along with $45 \mu \mathrm{~L}$ of phenol red and FBS free DMEM (Sigma Life Science, USA) was added to each well and incubated for 4 h at $37^{\circ} \mathrm{C}$ in presence of $5 \% \mathrm{CO}_{2}$. Then $50 \mu \mathrm{~L}$ of solublization buffer (R\&D systems, USA) was added to each well to solubilize the coloured formazan crystals produced by the reduction of MTT. After 24 h the optical density was measured at 550 nm using a microplate reader (BioRad, USA). The results (mean O.D. $\pm$ SD) obtained from quadruplicate wells were used in calculation to determine the $\mathrm{IC}_{50}$ of the test compounds.

The percent inhibition is then calculated from the formula:
$\%$ inhibition $=\quad$ Control O.D. - Sample O.D/._Control O.D. $\times 100$
The above IC-50 values for pyrimidines revealed that some of the compounds have significant anticancer activity against the cell line (DU-145) tested. Out of all the compound $\mathbf{P M}_{2}$ showed maximum activity, closely followed by $\mathbf{P M}_{5}$. A chloro group on the phenyl ring enhanced the anticancer activity. Compound $\mathbf{P M}_{14}$ also showed considerable anticancer activity. The thiophene ring contributed favorably to the observed anticancer activity, which is consistent with the literature reports.

## CONCLUSION

Chalcones derivatives were cyclised using guanidine hydrochloride, potassium hydroxide and ethanol to obtain pyrimidine derivatives. All the pyrimidine derivatives were evaluated for anticancer, antibacterial and anti fungal activities. 2-amino-4-(2',5'-dimethyl-3'-furyl)-6-(4"chlorophenyl)pyrimidine $\left(\mathrm{PM}_{2}\right)$ has exhibited excellent anticancer activity at the concentration of $50 \mu \mathrm{~g} / \mathrm{mL}$. Compounds which carries 4-dimethylaminophenyl, 2,4-dichlorophenyl and 4fluorophenyl substituent's at C-6 position of pyrimidine ring exhibited maximum antifungal activity. Compounds possessed the electron withdrawing substituent's on the aromatic ring exhibited maximum antibacterial activity.

## ACKNOWLEDGEMENTS:

Authors are thankful to the Head, Sophisticated Instrumentation Facility, IISC, Bangalore for ${ }^{1}$ H NMR Spectra and to Sipra Laboratories, Hyderabad for IR Spectra.
